

Bangladesh enphase energy

Bangladesh's economy grows rapidly, but the country remains highly vulnerable to climate change. To mitigate this impact, Bangladesh commits to implementing its climate goals, known as nationally determined contributions (NDCs) as part of the Paris Agreement. NDCs are specific targets and actions each country sets to reduce national emissions and adapt to climate impacts.

The latest NDCs, published in 2021, outline projects to develop renewable energy sources and improve electricity generation technologies. Efficient electricity supply through renewable sources is crucial for a successful energy transition. However, the adoption of new technologies in the country's electricity system development plans, such as the Integrated Energy and Power System Master Plan (IEPSMP), remains limited.

To integrate renewable energies successfully, stakeholders must align on a common strategy. Additionally, identifying energy efficiency potential on the demand side is essential to implement effective energy-saving measures. Consequently, this approach will ensure a comprehensive and coordinated effort towards achieving energy resilience.

The project aims to create a supportive political, regulatory, and economy environment to accelerate Bangladesh's eco-friendly energy transition. It highlights the application scenarios, potential, and limitations of eco-friendly technologies. To achieve its objectives, the project focuses on the following two measures:
