## Battery technologies el salvador

On 16th May 1984, our current business was first established in the UK - Alexander Technologies Europe Ltd was born. The business was founded by Alexander Technologies Inc, a corporation located in Mason City, Iowa, which had been in business since 1967.

The non-recourse debt for the batteries will be provided by IDB Invest, with the resources from the Canadian Climate Fund for the Private Sector of the Americas - Phase II (C2F2). The repayment schedule of the financing is linked to the operational savings the batteries will generate for the two solar farms. In line with its business model, the company will retain 100% ownership of the assets.

The consortium comprising TSK Electrónica and Gensun was chosen for the engineering, procurement and construction (EPC) of the batteries. Construction has already commenced, with commissioning scheduled for the second quarter of 2022. The batteries' millisecond response time will boost the quality of the primary and secondary reserve services, improving the stability and reliability of the electrical grid. The batteries will also reduce CO2 emissions by an estimated 5,000 metric tonnes per year, avoiding the use of fossil fuel power plants for ancillary services.
