Commercial microgrids central africa

The Africa Minigrids Program (AMP) aims to transform energy markets by leveraging solar-battery minigrids to enhance economic development and improve livelihoods through increased financial investment and innovative business models.

The 21 AMP countries represent a diverse set of African countries, each with their own energy market specificities and development contexts: large and smaller markets; Anglophone, Francophone, and Lusophone countries; small island developing states; and countries in post-crisis contexts.

With electricity powering every corner of life and work in modern society, the absence of reliable access to electricity can indelibly impact a community or country's ability to function, conduct business, and make the forward progress necessary for a positive and productive future.

These realities have placed more emphasis than ever on the need to expand access to reliable power in Africa. They have also led to concerted global efforts to establish minigrids in the continent's most underdeveloped regions. Deemed the quickest and most cost-effective way to bring power to remote locations where no large, central electric grids exist, microgrid projects in undeveloped regions worldwide are bringing hope to vulnerable communities that might otherwise be relegated to a future of poverty.

"Macrogrids" are centralized electric grids designed to serve large populations. Present in modern industrial economies such as North America, Europe, and China, macrogrids manage electricity supply and promote reliable energy generation and distribution to all customers.

"Microgrids" are local, self-sufficient energy systems that are designed to support a defined community of users. With their ability to either operate independently of a macrogrid or tap into it if necessary, microgrids help ensure greater resiliency, reliability, and power quality for users.

The Africa Minigrids Program (AMP) is one of several organizations currently working to promote global private and public investment in solar battery-powered minigrids throughout 21 countries across sub-Saharan Africa. Funded by the Global Environment Facility (GEF) and the United Nations Development Programme (UNDP), the organization aims to enhance quality of life and support socio-economic development for hundreds of millions of individuals for generations to come.

"While Africa remains the least electrified continent, it also has the biggest potential for solar minigrid deployment," confirmed Gabriela Elizondo Azuela, Manager of the World Bank's Energy Sector Management Assistance Program (ESMAP), which forecasts that solar-powered minigrids alone could power 380 million people in Africa by 2030 if properly supported and funded.

Minigrids hold great promise for providing access to electricity in undeveloped countries and communities worldwide, especially in Africa, where the use of minigrids could impact the greatest number of people most quickly.
