

## Electric vehicle costs malawi

Local renewable energy start-up, Sky Energy Africa, has officially unveiled Malawi's first electric vehicle (EV), the Citroen e-C3, on the market. Speaking during the launch on Friday, Sky Energy Africa founder and Managing Director Schizzo Thomson said the enterprise is a significant stride in the realm of sustainable transportation.

UNDP Malawi's greening journey began in December 2022 with the installation of a solar photovoltaic system covering 70 percent energy requirements. Significantly reducing reliance on diesel generators and the national grid resulting in substantial savings of up to US\$36,000 on diesel costs and helping reduce power outages that previously ...

One promising alternative is the adoption of electric vehicles (EVs), which not only offers an eco-friendly mode of transportation but also alleviates the burden of fuel dependency. The fuel crisis in Malawi has disrupted transportation, commerce, and even access to essential services.

As Malawi grapples with persistent fuel shortages and rising costs, the Malawi Energy Regulatory Authority (MERA) has proposed a bold vision for the country's future--one that shifts reliance from imported fuel to locally generated electricity.

Sky Energy Africa, a local renewable energy start-up launched by 33-year-old entrepreneur Schizzo Thomson, is set to become the first electric vehicle (EV) dealer in Malawi. Thomson envisions the EVs not just keeping Malawians moving amid the biting fuel scarcity, but also cutting air pollution and carbon emissions that fuel climate-related ...

Malawi is currently facing a fuel crisis, with rising fuel prices and frequent shortages impacting daily life and economic activities. As the nation is facing these challenges, it has become increasingly clear that sustainable solutions are essential for a brighter future. One promising alternative is the adoption of electric vehicles (EVs), which not only offers an eco-friendly mode of transportation but also alleviates the burden of fuel dependency.

The fuel crisis in Malawi has disrupted transportation, commerce, and even access to essential services. With prices soaring, many Malawians are struggling to afford daily commutes, impacting productivity and economic growth. The bus fares have almost doubled in price and the buses are becoming scarce leaving people with no other options but to pay the new prices.

This situation emphasises the urgent need for a sustainable solution that can help mitigate the effects of fuel shortages and environmental concerns. Electric vehicles represent a viable path forward. They reduce dependence on fossil fuels, which are subject to volatile market fluctuations. Additionally, EVs produce zero

tailpipe emissions, contributing to cleaner air and a healthier environment. As the world increasingly focuses on sustainability, transitioning to electric vehicles positions Malawi to be part of this global movement.

By investing in electric vehicles, we can reduce our carbon footprint, promote energy independence, and enhance economic stability. It's time for all Malawians to consider the potential of electric vehicles as a solution to our fuel crisis and a step toward a greener, more sustainable nation.

Lilongwe, August 19, Mana: Minister of Energy, Ibrahim Matola, says government through his ministry is committed to promoting the purchase and usage of electric vehicles in the country.

Matola, therefore, said that his ministry and the Ministry of Finance are striving to make purchase of electric vehicles affordable in the country. He called upon other stakeholders to join government in promoting the purchase and usage of electric vehicles in the country.

"I am aware that there are companies which started manufacturing electric vehicles in the country. I, therefore, call upon other companies, private sector and development partners to also join so that we should stand together to achieve our goal," he said.
