

Energy management 460 kWh

Energy management 460 kWh

The internally developed software, the Energy Management System (EMS), enables intelligent energy control. We distinguish three categories: Controllers, Optimizers, and Advanced Modules.

The dashboard provides convenient visual overviews of your solar energy, charging infrastructure, and consumption across your property or operation. Additionally, you always have live insight into the status of your battery system.

The Power Cube Modular is our most flexible model. Can be installed both outdoors and indoors and is easily scalable in both power and capacity. Even after it has been installed.

We develop, manufacture and service hydrogen fuel cells and other innovative hydrogen energy solutions for utility, industrial and commercial customers who seek cleaner and more reliable and sustainable energy sources to lower their carbon footprint.

We are a leading provider of stationary fuel cell solutions in some of the world's largest and fastest-growing markets. We are developing next-generation technologies for clean hydrogen production and clean fuel cell solutions for land and maritime transportation.

HyAxiom combines two words: "hydrogen" and "axiom", which means self-evident truth. We take it as an axiomatic truth that hydrogen, the most abundant element in the universe, is critical to accelerating sustainable carbon-free energy.

Our goal is to create an entire value chain based on a clean hydrogen ecosystem with a zero-carbon footprint, taking a giant step toward a sustainable, reliable energy future.

A fuel cell generates electricity--and in many cases, heat--through the interaction of hydrogen or hydrogen-containing fuel and oxygen through oxidation, an electrochemical process. The resulting chemical reaction produces electricity and heat. Unlike fossil fuel energy sources, such as coal or oil, hydrogen-based fuel cells operate without combustion, making them virtually pollution-free.

Sean Clancy, General Manager of Sheraton Harbor Island Hotel & Marina, discusses how PureCell(R) technology is supplying 70% of the hotel's power, saving the property \$250,000 per year in power costs.
