

## Energy storage regulations cyprus

Directive 2019/944 establishes common rules for the generation, transmission, distribution, energy storage and supply of electricity, together with consumer protection provisions, with a view to creating truly integrated competitive, consumer- centered, flexible, fair and transparent electricity markets in the Union.

The Cyprus Recovery and Resilience Plan will lead to the establishment of a regulatory framework for promoting the participation of storage facilities in the electricity market. This reform will facilitate the promotion of electricity generation from renewables, which is key for the efficiency and viability of the electric system of the country.

The Council of Ministers, the executive branch of the Cypriot government, has approved the nation's funding plan for energy storage systems installed in conjunction with renewable energy...

Systems up to 8MW were allowed without limitations (i.e. Storage requirements) Provided that all systems will be connected to the Grid and conclude a Power Purchase Agreement with EAC In addition to the above, the Transitional Market Regulation (TMR) was also put in effect, providing that RES producers are

the cost-performance of energy storage technology, leading to a significant increase of RES share in electricity generation. This report outlines the developing energy and climate policy framework of the European Union (EU) and how this is a driver for promoting energy storage in combination with Renewable Energy Sources (RES) and

The ministry also said the implementation of the aid plan for renewable energy source-based projects with the possibility of energy storage is set to be put to public consultation. The plan is set to cost between EUR10 million and EUR40m.

In addition, the ministry announced that it will commence the installation of central energy storage systems by the state, having now received the relevant approval from the European Commission. They say the total cost of these systems will be at least EUR40m.

The installation process is expected to be completed within 18 to 24 months for battery-based systems, while other technology storage systems may take longer than 24 months to be implemented.

The purpose of the public consultation is to collect suggestions and proposals regarding the basis of the framework and to better prepare and inform the investors who will participate in the support plan.

The ministry said the main objects of the plan are the reduction of energy costs, the reduction of power cuts from renewable sources, the reduction of carbon dioxide emissions and the reinforcement of Cyprus's energy
