Enphase's 8th-generation IQ 8 Microinverters are built using advanced 55nm technology chip. for The Enphase IQ8 Micro inverter series are grid forming during a power outage and storage compatible.

Enphase's 7th-generation IQ 7 Microinverters are powered by a unique software-defined architecture for an even more efficient design. The Enphase IQ7 Micro inverter series produces 4% more power, is 19% lighter and 17% smaller than the IQ6 series microinverters.

The state-of-the-art Enphase IQ8 Microinverter series, built on 8th gen Enphase technology, achieves unparalleled efficiency in module-level power electronics. With its advanced design, including a Class II double-insulated enclosure and plug-n-play connectors, installation has never been easier.

Offering unparalleled versatility and efficiency, the Enphase IQ8 series is optimized for the most recent high-powered PV modules, with compatibility spanning from 60-cell / 120 half-cell, 54-cell / 108 half-cell, 66-cell / 132 half-cell, and 72-cell / 144 half-cell configurations. With a maximum output power of up to 300 VA and a peak efficiency of 97.7%, the IQ8 series stands out as a leader in its class.

The IQ System is smart grid ready, with UL 1741 SA certification. Grid requirements will continue to evolve, the IQ System can easily adapt to future requirements thanks to remote update capabilities.

IQ8 Series Micro-inverters are UL listed as PV Rapid Shutdown Equipment and conform with various regulations, when installed according to manufacturer's instructions.

One of the challenges of conventional solar installations is efficiently managing inventory of junction boxes, watertight compression fittings, and off-the-shelf conduit and conductors needed to link up sections of a rooftop array. Any shortage of small electrical components adds significant time to the job as crew members restock at the hardware store or back at the warehouse.

The IQ System replaces numerous electrical balance of system components with the Enphase Q-Aggregator supporting up to three branch circuits and accepting the same plug-and-play connectors that connect to the microinverters, making any connector a place to feed or branch off to another part of the system.

Installers also have the option of using standard electrical components to transition branch circuits from the roof to the Enphase IQ Combiner Box with consolidated metering and networking equipment, including a preconfigured IQ Envoy communications gateway, at ground level. The IQ Combiner Box combines up to four electrical enclosures into one, eliminating the need for a separate subpanel, meter enclosure, Envoy enclosure, and AC disconnect, as well as all the hardware to connect these pieces together. One of the inherent limitations of string inverter systems is the need to always complete a loop in the electrical design. With these DC power systems, there's no opportunity to branch off to islanded arrays on complex rooftops or in response to on-the-fly design changes.
