

High output usb car charger

High output usb car charger

Still, this USB car charger's dual fast-charging ports, power, warranty and price point are a well-rounded lineup of features. Plus, Anker is a reliable brand known for its well-designed devices.

The USB-A puts out 2.4 amps of current, without quick charging, so you'll need a USB-C cable to get full performance out of the USB car charger. As a bonus, there's also blue halo lighting around the ports to keep them visible at night. Lastly, Anker provides a 1-year warranty with purchase.

The body of the charger is lightweight zinc alloy, which stands up readily to pressure and heat. A variety of color options are available in addition to the standard black. On the downside, each port only supplies 12 watts/ 2.4 amps, which leaves no quick charging options.

It's perfect for Android users, since that platform has adopted the USB-C standard for several years now. One of the cables provides quick charging, while the other gives a lesser 2.4 amp power supply.

This Scosche USB car charger is for those who just need to charge one device quickly over USB-C. It only has a single port, but that port gives you 30-watt quick charging. The manufacturer states that it charges a dead iPhone to 50 percent capacity in about 30 minutes.

Like the Superone, it features a compact, flush design. It also has a fabric pull tab so it's easy to remove from the dash. The charger is mostly black, with a dim LED power indicator along the top, so visibility may present an issue. As a bonus, Scosche includes a 3-year warranty, which we find to be exceptional for this type of product.

It won't charge as quickly as the previous Scosche model, but being able to plug in two devices at once may prove advantageous. Apart from a tiny white power indicator, the charger uses no integrated lighting.

For those that still have a bunch of USB Type-A cables lying around, this TeckNet USB car charger has you covered with four available ports. Only one of them is equipped with Quick Charge 3.0 compatibility, while the others contend with the slower 2.4 amp standard.

The whole device is surrounded with an illuminated blue ring which makes it visible at night, and shows when the power is running. The Quick Charge equipped port also has an internal light of its own, assisting the user in picking it out of the lineup.

The ESR HaloLock USB car charger is made to interface with the MagSafe charging system on iPhone 12 and newer generations up to the latest iPhone 15 models. However, it isn't compatible with Android or iPhones older than the 12th generation.

High output usb car charger

The charger magnetically locks to the phone, and holds it in place in either portrait or landscape orientation. In this way, it doubles as a hands-free phone holder while sending a wireless quick-charging current into the device.

The body of the charger mounts onto an A/C vent, with an included power supply cable running into the standard 12-volt outlet. The wireless unit gets its power from a Type-A to Type-C cable, leaving one free USB-A port on the power supply to use for other devices.
