## Off-grid systems st george

Off-grid systems st george

Utah off grid did a stellar job of installing my solar system in my enclosed trailer. Showed up on time and was professional. During the install when I had questions regarding the installation he took the time to explain his answer. They did a clean, functional install job, it blew my expectations of what I was looking for. I recommend using this company for your solar installation needs.

The sun over your home or commercial business is a natural source of energy for cheap electricity. Installation panel kits can lower cooling and heating costs by offsetting electric bills. Photovoltaic energy systems are hard at work anywhere the sun shines and no matter where you live you have an abundance of sunlight. Residential and commercial solar kits have no moving parts and require no maintenance lasting for decades.

DIY home installation kits start with DC electricity from sunlight. The output of solar kits varies throughout the day with changes in cloud cover and weather. The characteristics of DC electricity is different from AC current coming off the grid. Systems must utilize the entire solar day which typically is about 6 hours of useful sunlight.

The next step in choosing the right size solar panel kit after locating your average daily kWh usage then divide that by the number of available sun hours. For example, look to the sun map we provide. That solar irradiance that we show is compiled from 20 years of weather data and commonly used by solar companies when calculated the size of home or commercial systems. Example 18 kWh / 4.7 average sun hours = 3.8 kW x 1,000 (kW to Watts) = 3,830 watts needed.

Just a little more about "Saint George Solar Insolation". The suns insolation is measured in kilowatt hours per square meter per day in areas throughout the world. A common term used by solar installers everywhere is "sun-hours per day". To find the average sun-hours per day in Saint George, look at the solar insolation map provided by the team here at Blue Pacific Solar® in the LH column of our kit pages.

If you are sizing a solar panel kit for your grid tie home or off grid cabin use the lowest daily irradiance number which is December for your area. If you are looking for a utility grid-tied solar panel package with net metering, the average daily sun hours or solar insolation is what you want to use to start your planning. Either way for the best low cost solar panels for your home DIY installation or off-grid system Blue Pacific Solar® can provide you with the expertise and support to help you make the best choice for your budget.

The TetonX is a compact powerhouse. Weighing in at just over 3,000 lbs and including options such as an upgraded kitchen design, multiple shower room options, sleeping for up to 7, indoor eating, and a proprietary go-anywhere suspension, it's ready for the toughest adventures you can think of.

With Nomad Air Suspension, tire options up to 35", generous approach and departure angles, a sealed

powder-coated frame, and unrivaled ground clearance, the TetonX allows you to set up camp far from crowds.

The TetonX design uses over the fender construction to gain a massive amount of living space without compromising the compact footprint. Enjoy 6"6" of interior ceiling height and interior dinette seating.

Optional front and rear kitchen slides house an integrated fridge/freezer, sink, two burner stove, pantry and slide out table, giving you the use of a gournet u-shaped kitchen out on the trail.Family Friendly SleepingRoom for the whole family! In addition to the standard queen bed, the front storage area can be used for sleeping (24×76). The upper bunk feature comes in two sizes for even more sleeping options. Our single bunk is 24 inches in width and our double bunk is 48 inches.

SunHomes, co-founded by Alan Knudson and his father Joseph Knudson, believes that the answer lies in buildingsubdivisionsthat are sustainable, net-zero, and off-grid.

A cost-efficient solution to this, SunHomes believes, is buying raw land, which can range from roughly \$20,000-\$50,000 per acre (half-to-a-tenth of the cost). "The problem here is that bringing utilities to your lot or community is often very expensive and takes a long time, even decades, to be put in place."
