

Pros and cons of leasing solar panels

Pros and cons of leasing solar panels

A solar lease can help you avoid hefty up front installation costs and enable you to benefit from energy savings sooner. However, it can also negatively impact solar incentive savings and home value. We researched the pros and cons of solar leasing and how it compares to other financing options so you can decide if a solar lease is right for you.

Deciding whether to lease or buy solar panels? Our guide covers the key differences, pros, and cons of leasing versus buying to help you make the best decision.

Pros of solar leases. The three main advantages of a solar lease are: Saving money on electricity: With a solar lease, you'll save on electricity costs throughout your agreement. Low or no upfront costs: Unlike a cash purchase, solar leasing setups allow you to go solar without paying much (if any) money upfront.

As subject matter experts, we provide only objective information. We design every article to provide you with deeply-researched, factual, useful information so that you can make informed home electrification and financial decisions. We have:

Incorporated third-party data and information from primary sources, government agencies, educational institutions, peer-reviewed research, or well-researched nonprofit organizations.

We won't charge you anything to get quotes through our marketplace. Instead, installers and other service providers pay us a small fee to participate after we vet them for reliability and suitability. To learn more, read about how we make money, our Dispute Resolution Service, and our Editorial Guidelines.

Installing a home solar system is a smart long-term investment, and it's usually best to purchase your solar panel system rather than lease it. There are very few situations in which it will make more financial sense to lease solar panels than buy them outright or take out a solar loan.

Whether you take out a loan or sign a lease, going solar is a smart move because it saves you tens of thousands of dollars on your electric bill no matter how you choose to pay for your system. If you take out a solar loan there are more benefits than a lease because you own the system. Owning the system can increase the value of your home, attract more buyers, and help you sell your home at a higher price point.

Purchasing a new solar system outright with cash is by far the best way to reap the most financial rewards from your investment. However, the average homeowner may pause at the upfront cost - which is typically as much as \$20,000 or \$30,000 before tax incentives and rebates. If you have to decide whether to lease your system or purchase it with a solar loan, the majority of the time it makes the most sense to pay off your system with a solar loan because you own it outright at the end of your loan term. That's not the case with a lease.

Pros and cons of leasing solar panels

Down payments usually aren't required for either solar loans or solar leases, so you'll see immediate savings from both without having to make a significant cash expenditure.

Solar lease: After the first year of a solar lease, you'll experience annual rate increases known as an escalator, which means that each year your monthly payments will be higher. That's because your leasing company will typically raise your per kWh cost around 2-3% each year, which means you lose out on stable electricity costs, one of the benefits that makes solar panels so financially appealing.

Solar loan: Annual rate increases aren't written into solar loans. If you take out a solar loan, your monthly payments are fixed for the entirety of your loan term and remain consistent. There are two types of solar loans - secured and unsecured - which we'll explain in more detail below.
