

Retrofit batteries to solar system

Retrofit batteries to solar system

An AC-coupled retrofit involves installing a separate inverter for your battery, allowing you to keep your existing solar inverter. Without the need to redesign or rewire your solar panel system, this option is typically more affordable upfront.

If you're wondering whether or not you can install batteries in your existing solar system, the answer is yes! There are several ways you can integrate battery power into your existing solar system.

Once you've chosen your installer and your equipment, it only takes a few hours to retrofit the battery to your solar panels. Then you'll be optimizing your solar investment and enjoying free, clean energy at all times of day. Learn more about Panasonic's new EVERVOLT[®] home battery system and how it can help you save more money on energy.

Retrofit solar batteries can significantly increase your energy independence and provide backup power during outages. Assessing your current solar system is crucial before deciding to retrofit a battery. Choosing the right battery depends on factors like capacity, power rating, and compatibility with your existing setup.

For years, batteries have been a way to store excess power for solar systems. But until recently, they only made sense for a few, mostly off-grid solar systems due to their high cost and low efficiencies. However, as battery prices continue to decline and batteries become more and more effective, they are also becoming a viable option for many grid-tied solar systems.

Batteries may not have made sense if you installed your system a few years ago. But as the market changes and technology advances, you may find yourself wishing you could take advantage of energy storage.

As the sun shines, your solar panels collect the energy and turn it into DC electricity. The electricity is then sent to your inverter, which converts that power into AC electricity - the form you can use in your home or business. As your system produces energy, it's used to power your lights, appliances, and devices. But what happens when your system produces more electricity than you use?

If you install a battery, here's where it comes in. When you're using more electricity than your solar system is producing, you can draw on energy stored in a battery instead of drawing it from the grid.

In most cases, adding a battery to an existing grid-tied solar system is possible, however, the level of difficulty is dependent on whether or not your system was designed with the intention to do so. Here are the ways to install a battery in your existing solar system.

Best-case scenario, you knew you'd eventually want to install batteries and planned for it when having your

Retrofit batteries to solar system

system installed. Maybe you were waiting for prices to drop or wanted to keep the upfront investment during installation as low as possible. Either way, you prepared yourself for the future. Your inverter is ready for the installation of a battery when it makes financial sense to you. This is the cheapest and easiest option, requiring less labor and materials than the other two options.

With a DC Coupled System, your inverter will be replaced by one that works with a battery and a solar system. These are known as hybrid inverters. DC power produced by your solar panels is used to charge the battery. From there, the power is passed through the hybrid inverter, which converts the power into AC electricity. Then, the AC power can be used either in your home or business or go to the grid.

DC Coupling could be a great option for you if you've had your solar system for some time and your inverter is approaching the end of its expected life. Most string inverters last fifteen years, so replacing your inverter a little earlier with one that works with a battery could be to your benefit.
