Solar batteries can provide financial savings, the ability to keep the lights on during utility power outages, and can even enable you to go off-grid-so it's no surprise that battery storage systems are becoming popular additions to solar energy projects of all scales.

Regarding the configuration of your solar panels, batteries, and inverters in your home energy system, there are two main options: alternating (AC) and direct (DC) coupling. AC and DC coupling have advantages and drawbacks, so that the best system will depend on your needs and the specifics of your solar + storage installation.

Solar panels generate DC electricity that must be transformed (via inverters) into AC electricity, the type of electricity used by most of your home's appliances. Solar batteries store electricity in DC form. So, the difference between AC-coupled and DC-coupled batteries lies in whether the electricity generated by your solar panels is inverted before or after being stored in your battery.

In an AC-coupled system, DC power flows from solar panels to a solar inverter, transforming it into AC electricity. That AC power can then flow to your home appliances or go to a battery inverter that converts the electricity back to DC for storage. With AC-coupled systems, any electricity stored in the battery system must be inverted three times before use.

In a DC-coupled system, DC solar electricity flows from solar panels to a charge controller that directly feeds into a battery system, meaning there is no inversion of solar electricity from DC to AC and back again before the battery stores the electricity. Any electricity the solar panels produce will be inverted only once (from DC to AC) as it flows from batteries to your home appliances or the electrical grid.

Historically, AC-coupled battery storage setups have been more common for residential and commercial solar installations. As more DC options become available, DC-coupled solar batteries are gaining popularity.

A solar panel's efficiency measures its ability to convert sunlight into solar energy, and a solar inverter's efficiency measures how well it converts this solar energy into usable AC electricity. For batteries, it's a bit more complex.

Most solar batteries are rated on roundtrip efficiency, which measures how much electricity is lost when you charge and discharge them. The higher the efficiency percentage, the more efficiently the battery can convert incoming electricity into stored electricity and back into usable electricity. For example, if you send 10 kilowatt-hours (kWh) to your battery for storage and can take 9 kWh out for usage, your battery has a roundtrip efficiency of 90%.

The main advantage of AC-coupled solar battery systems is their ease of installation when retrofitting storage to an existing solar system. Easier installations require less labor and time for solar installers, which often means a lower upfront cost.
