Solar cell 75 kWh

Solar cell 75 kWh

A 75kW solar system is a perfect capacity solar system for large businesses that require high energy. With this solar system, you can switch to clean renewable energy at an affordable rate and cut down your electricity bill payment.

Its a complete solar setup with solar panel, solar inverter & solar batteries that required approx. 350 Sq. meter shadow + gap free area for installation. It produces 300 units of electricity every day throughout the year. However, the actual generation is affected and determined by several factors like sunlight, outside weather, angle of installation, etc.

The 75kW solar system is generally used at places like malls, large scale institutes, restaurants, hotels, industries, guest houses etc. where electricity demand is high. The average payback period of a 75kW solar power system is 3 to 6 years, depending on the type of solar system.

There are three types of 75kW solar system available in various technologies, so it's worth spending 10 minutes reading this information and selecting your solar system based on your needs.

The price of a solar system is subjected to various factors that include its brand, components, capacity and type. The solar price is generally represented in the price per watt. For solar systems, the rate per watt generally lies between Rs.38 to Rs.50.

With increasing competition in the solar market, the price range of solar systems is reducing day by day. The best prices for purchasing a 75kW solar system are given below.

To meet the requirements of every individual, the solar market offers various options for purchasing a solar system. There are several capacities, types, brands and components of a solar system and you can have each of the factors customised for your specific needs.

Out of the three, the first works with the main grid, the second works independently while the third has benefits of both the above two 75kW solar systems.

An on-grid 75kW solar system is tied to the main electricity grid for operating. It works by collecting sunlight and producing solar energy. This electricity produced is converted to AC and is used directly to supply power to the loads.

On-grid solar system will be directly connected to the government grid. As a result, when solar electricity is unavailable, the 75kW system uses electricity from the grid to satisfy its power needs.

When an on-grid solar power system is producing more power than your load, then excess power can be fed into the utility grid through solar net-metering. It does not work when the main grid is not available.

A 75kW on-grid solar system comes with solar panels, an on-grid inverter, an MC4 connector and a solar structure. Other solar accessories include AC and DC junction boxes and cables.
